

Ultimately, this system will serve as a scalable and adaptable solution for organizations that rely on shared resources, ensuring efficient resource management and seamless scheduling operations without requiring integration with external enterprise tools.

QUEZON CITY UNIVERSITY

COLLEGE OF COMPUTER STUDIES

Specific Objectives:

1. **Develop a web-based interface** – The system will feature an intuitive and user-friendly interface that allows users to search for available resources and make reservations efficiently. A structured layout will display different resource categories, ensuring users can easily navigate and find what they need.
2. **Implement role-based authentication** – The system will allow anyone within the organization to submit booking requests; however, approval from an administrator will be required before a reservation is finalized. Role-based authentication will ensure that only authorized individuals are granted access to resources, maintaining proper oversight and preventing unauthorized usage.
3. **Integrate real-time availability tracking** – Users will be able to view resource availability in real time, ensuring that double bookings are avoided. A dynamic and interactive calendar will provide a clear visual representation of reserved and available time slots.
4. **Provide admin management tools** – The admin panel will include features for adding, modifying, or retiring resources based on organizational needs. Utilization reports will offer insights into frequently booked resources, helping optimize resource allocation. A dispute resolution system will allow admins to handle overlapping requests or misuse of reservations.
5. **Enable advanced search filters** – Users will have access to advanced search filters that streamline the booking process by allowing them to refine their search based on specific needs such as location, time, and equipment availability. The filtering system will help users quickly find the most suitable resources without manual browsing.

Scope:

1. **Manage shared resources** – The system will facilitate the reservation of various shared resources such as meeting rooms, event spaces, office equipment, and specialized tools. It will provide a structured database for maintaining resource details, including descriptions, locations, and availability.
2. **Implement user roles** – Three primary user roles will be established, including employees who can browse resources and submit booking requests, managers who can oversee reservations, and administrators who can **review, approve, or deny bookings**. Each role will have different levels of access and permissions to ensure structured resource management.
3. **Provide scheduling tools** – The system will feature an interactive calendar that displays bookings in real time. Users can submit booking requests through the calendar interface, but reservations will not be finalized until approved by an administrator. Automated alerts and notifications will inform users of the status of their requests.
4. **Include an admin dashboard** – The admin dashboard will provide tools for adding and removing resources, adjusting permissions, generating usage reports, and resolving booking disputes. Administrators will also have control over **approving or rejecting reservations** to ensure resource allocation aligns with organizational needs.
5. **Support customization** – Organizations will be able to configure booking policies such as maximum reservation duration, priority access, and blackout periods. The platform will support different types of resources, ensuring adaptability to specific institutional or corporate needs.

Limitations|Delimitations:

1. **Dependence on admin updates** – The effectiveness of the system relies on administrators keeping resource listings up to date. If resources are not managed properly, users may encounter outdated availability or incorrect information.
2. **Requires stable internet connection** – Since the system operates as a web-based platform, real-time availability tracking and calendar updates depend on an active internet connection. Users in areas with poor connectivity may experience delays or access issues.
3. **Focus on physical and digital resources** – The system is designed only for booking shared spaces, equipment, and tools, excluding personnel scheduling or task management. It will not handle employee shift planning or project management.

4. **No integration with external systems** – The platform will function as a standalone system and will not sync with external enterprise software such as payroll, HR management tools, or third-party scheduling applications.
5. **Web-based only** – The system will be accessible via a web browser on both desktop and mobile devices, but a dedicated mobile application will not be developed within the scope of this project.

Note: This part is to be accomplished by the Subject Adviser.
