

RESEARCH PROPOSAL
MS102 – QUANTITATIVE METHODS

Group No: 2

Section: SBIT - 3L

Proposed Research Title: The Impact of Last-Minute Coding on Program Quality and Academic Performance Among 3rd Year BSIT Students
Research Leader: Peregrino, Princess Mae S.
Assistant Leader: Tan, Maria Raye T.

I. Introduction

Background of Study

System development in IT is a very detailed process that involves careful logging and development and trial-and-error debugging as parts are created. Many students procrastinate and only do the majority of their work in a few hours or days right before the deadline; many then claim that they do 'better under pressure.' However, coding is more sensitive to time constraints than other types of work; therefore, one rushed error may stop the whole coding system from working.

Also, this process is risky for all 3rd-year BSIT students because this year includes many difficult courses, including Advanced Database Systems and Web Development, which are the prerequisites/requirements for their 4th-year Capstone course. Procrastinating leads to "spaghetti code," little to no documentation, and bugs that have not been dealt with, which all contribute to lower program quality; additionally, the stress level and lack of sufficient trials created because of having to rush create lower academic performance. The purpose of this

QUEZON CITY UNIVERSITY

San Bartolome, Novaliches, Quezon City
Bachelor of Science in Information Technology

study is to collect data regarding how often last-minute coding occurs and quantify how much of an effect it has on the technical and academic results of students at Quezon City University.

Statement of the Problem

1. How often do third-year BSIT students at Quezon City University, practice "last-minute coding"?
2. What is the quality of programs created by third-year BSIT students who practice "last-minute coding"?
3. How well did the respondents do academically, relative to their major programming classes?
4. Is there a correlation between the use of "Last-Minute Coding," the quality of programming projects, and how well they did in school?

Hypothesis:

- There is a significant relationship between last-minute coding, program quality, and academic performance of third-year BSIT students at Quezon City University.

Null Hypothesis :

- There is no significant relationship between last-minute coding, program quality, and academic performance of third-year BSIT students at Quezon City University.

II. Purpose of the Study

The purpose of this research is to find out the effect of last-minute coding on the quality of coding outputs and the academic performance of third-year BSIT students of Quezon City University. Specifically, this research will try to find out the frequency of last-minute coding done by students, the quality of programs produced by students, the academic performance of students in major programming subjects, and the relationship of these variables. The findings of this research can give students, teachers, and the university an idea of the possible effects of procrastination in coding.

Objectives

Main Objective:

This study aims to analyze the detrimental effects of last-minute coding practices on the program output and academic grades of 3rd Year BSIT students.

Specific Objectives:

1. To profile the last-minute coding habits of 3rd Year BSIT students
2. To assess the perceived and actual impact of last-minute coding on program/code quality

QUEZON CITY UNIVERSITY

San Bartolome, Novaliches, Quezon City
Bachelor of Science in Information Technology

3. To compare the experiences of students like to plan vs. students who crams more
4. To track the bug-to-deadline ratio.
5. To quantify the stress and burnout factor.
